T DOMAIN PRINCE: 291 ATP (BY SIMILARITY).
gamma T,' an isoform of phosphorylase kinase catalytic subunit.";
J. Biol. Chem. 267:1455-1463(1992).
-!- FUNCTION: PHOSPHORYLASE B KINASE CATALYZES THE PHOSPHORYLATION OF SERINE IN CERTAIN SUBSTRATES, INCLUDING TROPONIN I. THIS ISOZYME MAY REGULATE GLYCGGENEOLYSIS IN THE TESTIS.
-!- CATALYTIC ACTIVITY: 4 ATP + 2 phosphorylase B = 4 ADP + phosphorylase A.
-!- SUBUNIT: POLYMER OF 16 CHAINS, FOUR EACH OF ALPHA, BETA, GAWMA, AND DELTA A. BLERGULATORY CHAINS, GAWMA, CATALYTIC CHAIN, AND DELTA ALE REGULATORY CHAINS, GAWMA IS THE CATALYTIC CHAIN, AND DELTA ALE REGULATORY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Sequence 2.3 Application US/08305871A

Patent No. 575612

GENERAL INFORMATION:

APPLICANT: Sette, Alessandro

APPLICANT: Grevy, Howard M.

APPLICANT: Sidney, John

APPLICANT: Sidney, John

APPLICANT: Alexander, Jeffrey L.

TITLE OF INVENTION: Alteration of Immune Response Using Pan

TITLE OF INVENTION: D-Binding Peptides

NUMBER OF SEQUENCES: 29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match 71.4%; Score 25; DB 1; Length 13; Best Local Similarity 100.0%; Pred. IS GURBAND.
Sequence 30, Application US/08788822A
Sequence 30, Application US/08788822A
Patent No. 6413935
GENERAL INFORMATION:
APPLICANT: Alexander, Jeffrey L.
APPLICANT: Sette, Alessandr.
TITLE OF INVENTION: Induction of Immune Response Against
TITLE OF INVENTION: Desired Determinants
NUMBER OF SEQUENCES: 30
CORRESPONDENCE ADDRESS:
ADDRESSEE: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
CITY: San Francisco
STRIE: California

                                                                                              RESULT 13
US-09-075-257A-15
US-09-075-257A-15
Sequence 15, Application US/09075257A
Patent No. 6074645
GENERAL INFORMATION:
APPLICANT: DIAMOND, DON JEFFREY
APPLICANT: DIAMOND, DON JEFFREY
TITLE OF INVENTION: IMMUNO-REACTIVE PREPTIDE CTL EPITOPES
ITILE OF INVENTION: OF HUMAN CYTOMEGALOVIRUS
NUMBER OF SEQUENCES: 20
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match 71.4%; Score 25; DB 3; Length 28; Best Local Similarity 100.0%; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Asymptotherical protein 2 - garlic mosaic virus
C;Species: garlic mosaic virus, GarMV
C;Dete: 20-Feb-1995 #sequence_revision 20-Feb-1995 #text_change 08-Oct-1999
C;Accession: S2386.
C;Accession: S2386.
R;Choi, J.N.; Choi, Y.H.; Choi, Y.D.; Lee, J.S.
Submitted to the EMBL Data Library, June 1992.
A;Description: Nucleotide sequence of a cDNA for garlic mosaic virus.
A;Accession: S23862
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

1. FUNCTION: Transfers the 4'-phosphopantetheine moiety from coenzyme A to a Ser of acql.carrier protein (By similarity).

2. CATALYTIC ACTIVITY: CoA + apo-[acyl-carrier protein] = adenosine 3'.5'-bisphosphate + holo-[acyl-carrier protein].

2. Subcrick Magnesium (By similarity).

2. SUBCRICULAR LOCATION: Cytoplasmic (By similarity).

2. SIMILARITY: BELONGS TO THE P-PANT TRANSFERASE SUPERFAMILY. ACPS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. REVERSIBLE OXIDATION-REDUCTION OF METHIONINE SULFOXIDE IN PROTEINS
                                                                                                                                                                        TISSUE=Adremal medulla, MEDLINE=96112545; PubMed=8700890; Moskovitz J., Welssbach H., Brot N., "Cloning the expression of a mammalian gene involved in the reduction of methionine sulfoxide residues in proteins.", Proc. Natl. Acad. Sci. U.S.A. 93:2095-2099(1996).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TO METHIONINE.
CATALTIC SCTIVITY: Protein L-methionine + oxidized thioredoxin = protein L-methionine S-oxide + reduced thioredoxin.
SIMILARITY: BELONGS TO THE MSRA MET SULFOXIDE REDUCTASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        lic-OCT-2001 (Rel. 40, Created)

                                                                                                                         "Primary Structures of two homologous subunits of PA28, a gamma-interferon-inducible protein activator of the 20S proteasome."; FBBS Lett. 366:37-42(1995).

-!- FUNCTION: Implicated in immunoproteasome assembly and required for efficient antigen processing. The PA28 activator complex enhances the generation of class I binding peptides by altering the cleavage pattern of the proteasome.
-!- SUBUNIT: HETERODIMER OF PSME1 AND PSME2, WHICH FORMS A HEXADIMERIC

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(See also AAR73201-592).
                             The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MHC molecules, which are encoded by most of the alleles of a DR locus. The peptide can be used to inhibit or induce MHC class II mediated activation of T-cells or helper T-cells, which themselves mediate a CTL response. The peptide can be used in mammals, especially humans, to inhibit T-cell-mediated events involved in allograft rejection, allergic responses and autoimmunity and as a vaccine adjurant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, AIDS, renal and cervical carcinoma, lymphoma, CMV and condylyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polypeptide(s) having affinity for the human TSH receptor antibody - used in detection of the TSH antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        thyroid stimulating hormone receptor; TSH; human; Homo sapiens; antibody; affinity; detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The invention relates to human leukocyte antigen (HLA) pan DR-binding comprising a fragment of a stress protein that binds to one or core more major histocompatibility complex (MHC) class II molecules. The peptides invention also relates to heat shock protein (hsp) peptides. The peptides of the invention and thr immunomodulating composition comprising these compatibility complex (MHC) treating or preventing an immune-compatibility complex that is a mammallal subject e.g. human, having or at risk of having a disease in a mammallal subject e.g. human, having or at risk of theumatoid arthritis, lups erythematosus, mysathenia gravis, type I diabetes, scleroderma, ulcerative colitis, cancer (e.g. melanoma, leukaemia, lung, liver, kidney, brain, bladder solid tumours, retinoblastoma, sarcoma and connective tissue cancers) and infectious diseases. The peptides of the invention are also useful for screening copptides are useful for treating autoimmune diseases or disorders connective tissue disease, primary bilary cirrhosis, permicious canaemia, autoimmune thyroiditis, vitiligo, idiopathic Addison's disease, condisorders anaemia, autoimmune thyroiditis, vitiligo, idiopathic Addison's disease, primary bilary cirrhosis, autoimmune hubroiditis, vitiligo, idiopathic thromobocytopeania purpura, pemphigus vulgaris, autoimmune infertiility, Goodpasture's syndrome, pemphigus vulgaris, autoimmune infertiility, Goodpasture's syndrome, pemphigus vulgaris, autoimmune infertiility, Goodpasture's syndrome, pemphigus house infertiility, Goodpasture's syndrome, ferbener ce pehtide cis PADRE, a pan-DR binder peptide used in the exemplification of the house constituent of the control of the control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antigenic; antidiabetic; neuroprotective; antirheumatic; antiarthritic; dermatological; immunosuppressive; ophthalmological; antiallergic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human leukocyte antigen pan DR-binding peptide, useful for treating immune mediated diseases and conditions, has a fragment of stress protein that binds to major histocompatibility complex class II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                69.4%; Score 25; DB 23; Length 11;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                       This synthetic peptide, termed PADRE 965.10, is characterised as a pan-DR binder peptide. PADREs of comparable affinity were used as model antigens to identify human antigens specific T cells in an experiment designed to demonstrate that capture of T cells by artificial antigen presenting cells (APC) is effective in identifying polychonal class II restricted human T cells. The identifying polychonal class II restricted human T cells. The invention is directed to artificial APC, and methods of making APC used to isolate and expand T cell populations and to modulate T cell responses. The invention and antigen-specific T cells. The methods provide for the construction of liposomes containing MHC:peptide complexes, accessory molecules, co-stimulatory molecules, adhesion molecules, and other molecules irrelevant to T cell binding or modulation that are used in the binding of artificial APC to solid support systems that may be used in the retrival and identification and antigen-specific T cells. Devices and methods are provided for treating conditions that would benefit from modulation of T cell response, e.g. autoimmune disorders ceptendally type I diabetes mellitus, multiple sclerosis, rheumatoid arthritis, dermatomiosytis, juvenile rheumatoid arthritis, and uveitis), allergies, cancer, viral infections, and caraft reference.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human leukocyte antigen; HLA; DR-binding peptide; therapy; stress protein; major histocompatibility complex; MHC; antiulcer; type I diabetes; scleroderma; heat shock protein; hsp; vitiligo; rheumatoid arthritis; lugue srythematosus; myasthenia gravis; tumour; polywyositis; chronic active hepatitis; primary biliary cirrhosis; pernicious anaemia; autoimmune thyroiditis; sjogren's syndrome; cancer; oranges autoimmune disease; multiple sclerosis; hepatorropic; francer; bowel so disease; autoimmune disease; multiple sclerosis; hepatorropic; antilammatory bowel disease; Goodpasture's syndrome; neuroprotective; antimicrobial; immunosuppressive, dermatological; antiinflammatory; antiinflammatory; antiinfertility; idiopathic Addison's disease; cytostatic.

The invention relates to an artificial antigen presenting cell (I)

Comprising liposome, major histocompatibility complex (WHC), antigen an accessory molecule components. (I) is used in methods for the following: (1) identifying T cells specific for an antigen of interest; (2) isolating T cells specific for an antigen of interest; (3) modulating T cells precific for an antigen of interest; (3) modulating T cells represent the functional state of antigen specific T cells; (5) treating a condition in a subject which would be specific T cells; (5) treating a condition in a subject which would be certain antigen-specific T cells to increase Thelper (Th) 2 response and or dor decrease Thi response; (6) identifying antigen-specific T cells specific for epitopes on a graft donor's tissue likely to elicit graft versus host rejection of allografts in a transplantation therapy regime.

Method (5) is useful for treating autoimmune disease such as type I diabetes mellitus, multiple sclerosis, from therapy regime.

Method (5) is useful for treating autoimmune disease such as type I diabetes mellitus, wultiple sclerosis, from a contension or chemicals, cancer, viral infection, bacterial infection, Addition of the accessory molecules, as well as co-stimulatory molecules, and other proteins in proper orientation in the liposomes allow for substantially improved the constitution of the constantial infection of the constantial infection of the constantial infection and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

Peptides capable of binding MHC class II molecules via antigen binding sites (pan DR-binding peptides) were synthesised. Peptide ARAN70249 is capable of binding MHC class II molecules causing T cell activation. This is useful as a vaccine component and may be used in conjunction with CTL peptides to enhance a CTL response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                            Inhibiting or inducing an immune response using Pan DR-binding peptide(s) - to prepare a compsn. used to treat allo-graft rejection, allergic response and auto-immunity and as a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0

caliciting an immune response to a non-protein antigenic determinant.

The composition comprises of the PARRE peptide covalently linked to the non-protein antigenic determinant. The composition is used to induce a cherapeutic or prophylactic response, particularly to selected to induce a provides antigens associated with tumours or infectious agents. It convides a high level, long-lasting IgG immune response. The composition is also used to produce monoclonal antibodies which are potentially useful as therapeutic and diagnostic agents. The composition can be used to diagnostic and intended to treatment with the non-protein can infections. PADRE peptides have broader specificity and higher chronic infections. PADRE peptides have broader specificity and higher the proliferative response of human T cells expericted by at least 6 different DR molecules, and act as helper epitopes of in vivo induction
                                                                                                                                                                            Composition for eliciting immune response to non-protein determinant - comprises the determinant and a pan-DR binding peptide, used for prevention and treatment of tumours and infections
                                                                                                                                                                                                                                                                                   (pan-DR binding) peptide is used in a composition for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptides capable of binding MHC class II molecules via antigen binding sites (pan DR-binding peptides) were synthesised. Peptide AAR70250 is capable of binding MHC class II molecules causing T cell activation. This can be used as a vaccine component. The peptide can also be used in combination with CTL peptides to enhance a CTL response.

The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MHC molecules, which are encoded by most of the alleles of a DR locus. The peptide can be used to inhibit or induce MHC Class II mediated activation of T-cells or helper T-cells, which themselves mediate a CTL response. The peptide can be used in mammals, especially humans, to inhibit cresponses and autoimmunity and as a vaccine adjuvant for enhancing in immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e g. prostate cancer, hepatitis B, hepatitis C, AlDS, renal and cervical carcinoma, clymphoma, CWV and condylyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptides that bind to MHC molecules of all DR alleles - inhibiting or inducing MHC Class II mediated activation of T cells
        Peptides that bind to MHC molecules of all DR alleles - inhibiting or inducing MHC Class II mediated activation of T cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence, a pan DR binding peptide, is capable of binding antigen binding sites on MHC Modecules, which are encoded by most of the alleles of a DR locus. The peptide can be used to inhibit or induce MHC class II mediated activation of T-cells or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pan DR binding peptide; antigen binding site; MHC molecule;

                                                                                                                                                                                                                                           caliciting an immune response to a non-protein antigenic determinant.

The composition comprises of the PADRE peptide covalently linked to the composition comprises of the PADRE peptide covalently linked to the composition comprises of the PADRE peptide covalently linked to the composition is used to induce a therapeutic or prophylactic response, particularly to selected polysaccharide antigens associated with tumours or infectious agents. It provides a high lavel, long-lasting IgG immune response. The composition is also used to produce monoclonal antibodies which are potentially useful as therapeutic and disgnostic agents. The composition can be used to disgnose susceptibility of a patient to treatment with the non-protein antigenic determinant or to predict subjects at risk from developing chronic infections. PADRE peptides have broader specificity and higher the proliferative response of human T cells restricted by at least 6 different DR molecules, and act as helper epitopes of in vivo induction of cytotoxic T cells and antibody production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention is concerned with methods of treating asthma, eosinophilia, allergic thinitis and other allergic diseases. These involve the use of interleukin-5 (IL-5) analogues and modified IL-5 broceins and their coding sequences to down-regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and helminthic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Asthma; IL-5; interleukin-5; allergy; cytokine; helminthic infection; cancer; eosinophilia; vaccine; allergic rhinitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophlaxis or amelioration of asthma or other chronic allergic conditions -
helper T-cells, which themselves mediate a CTL response. The peptide can be used in mammals, especially humans, to inhibit T-cell-mediated events involved in allograft rejection, allergic responses and autoimmunity and as a vaccine adjuvant for enhancing an immune response against an administered immunogen. The peptide can be used with other immunogens to treat, e.g. prostate cancer, hepatitis B, hepatitis C, AlbS, renal and cervical carcinoma, lymphoma, CMV and condylyloma acuminatum.

This sequence represents a universal helper T epitope, pan DR epitope (PADRE). DNA encoding which is used to construct fusion genes used in exemplifications of the present invention. The invention relates to a movel expression vector comprising a promoter operably inked to a fusion gene encoding a major histocompatibility complex.

CC include to a fusion gene encoding a major histocompatibility complex.

CMHC) targetting sequence, and ye a class I targetting sequence, which can general mAGC class I epitope to a cytosolic pathway or to the endoplasmic reticulum, or an MHC class II targetting sequence, which can endoplasmic reticulum, or an MHC class II targetting sequence, which can endoplasmic reticulum, or an MHC class II targetting sequence, which processed into antigen poptides for presentation on MHC class II molecules. The heterologous epitopes may comprise either helper T propercyte (HTL) epitopes or a cytocoxic I lymphocyte (HTL) epitopes, or a cytocoxic I lymphocyte (HTL) epitopes, or a cytocoxic I lymphocyte (HTL) epitopes uch as a pan DR epitope (PADRE). The vectors are universal HTL epitope such as a pan DR epitope (PADRE). The vectors are useful for stimulating an immune response in vivo, as well as for use in cytor in a non-human immunogenicity of a human T cell peptide epitope in cytor in a non-human mammal. They provide a nucleic acid vaccine for cubancing immunity against infectious pathogens, such as viruses (e.g., Plasmodium falciparum, the cause of malaria) and also tumour cells and autoimmune diseases. Universal MHC class II epitopes are advantageously combined with other MHC class I and class II epitopes to increase the number of cells that are activated in response to a given antigen and provide a broader population coverage of MHC-reactive alleles.
                                                                                                                                                                          Chimeric; Ii protein; pan DR epitope; expression vector; promoter; major histocompatibility complex; MHC; targetting; peptide; epitope; antigen; presentation; class I; qytosolic pathway; endoplasmic reticulum; class II; extracellular antigen; endocytic pathway; helper T lymphocyte; HTL; universal epitope; cytocoxic T lymphocyte; CTL; immune response; immunogenicity; assay; vaccine; immunity; infection; pathogen; virus; HIV; HBV; HCV; hepatitis B; hepatitis C; bacterium; protozoan; tumour cell; autoimmune disease; activation; antiviral; antimalarial;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of determining the surface density of a cell-surface molecule on a primary or artificial antigen-presenting CC cell (APC). The method comprises determining the cell surface area of the APCs, determining the absolute amount of cell surface molecule to the APC surface area as a measure of cell surface molecule to the APC surface area as a measure of cell surface molecule to the APC surface area as a measure of cell curface molecule to the APC surface area as a measure of cell surface molecule to the APC surface area as measure of cell curface molecule to the APC surface area as measure of cell curface molecule to the APC surface area as measure of cell curface in the cell-surface density of a complex of peptide and MHC (major histocompatibility complex) protein/peptide complex on an APC; densitying an agent that increase persistence of the MHC/peptide complex on an APC surface by culturing APCs in presence of test compound and measuring the APC carries a therapeutically adequate amount of complex or and determining whether the cell-surface density of the MHC/peptide complex is 100 molecules/square micrometre or more. The method is used to determine if the amount of MHC/antigenic peptide complex present on the surface of an APC is sufficient for therapeutic cure of the cells as cellular vaccines or for ex vivo expansion of antigen-specific T cells for subsequent return to the patient, antigen-specific T cells for subsequent return to the patient, complex present on MHC/peptide complexes on cells, (which increases the therapeutity potential of the cells) by treatment before and/or during
                                                                                                  o;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining surface density of molecules on antigen-presenting cells, useful for quality control of cellular vaccines for treatment of tumors and infections comprises measuring density ratios -
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cellular vaccine, antigen-presenting cell; APC; cell-variface molecule density; major histocompatibility complex; MHC; antigen-specific T-cell expansion; tumour; cancer; viral infection; paramitic infection; Pan-DR binding peptide; PADRE.

APC administration. The method allows identification of therapeutically
               useful antigen-pulsed APC optimisation of conditions for their production, and control of APC quality. Sequences AAB73643-AAB73648 represent peptides used in MHC binding studies and for the generation of peptide-specific cyctoxic T-lymphocytes.
